

Home Fire Sprinklers Save Lives and Water

MAKING THE CONNECTION

- Fire sprinklers are linked by a network of piping, connected to the domestic water supply.
- Only the sprinkler closest to the fire activates.
- NFPA 13D requires the water supply to accommodate 1 or 2 operating sprinklers for 10 minutes.
- Fire sprinklers use 90% less water than fire departments use.
- Only heat from a fire will activate the sprinkler.
